The 3-D nucleon structure (and the EIC - Talk by R. Yoshida)

Mauro Anselmino - Torino University & INFN Lepton-Nucleus Scattering XIV - Elba June 27, 2016

usual (successful) way of exploring the proton structure (collinear parton model)

QCD interactions induce a well known Q² dependence

DIS – pQCD :
$$q(x) \Rightarrow q(x, Q^2)$$

PDFs

factorization:

universality: same $q(x,Q^2)$ measured in DIS can be used in other processes

H1 and ZEUS

$$\sigma_{r,\text{NC}}^{\pm} = \frac{\mathrm{d}^2 \sigma_{\text{NC}}^{e^{\pm}p}}{\mathrm{d}x_{\text{Bj}} \mathrm{d}Q^2} \cdot \frac{Q^4 x_{\text{Bj}}}{2\pi \alpha^2 Y}$$
$$Y_{\pm} = 1 \pm (1 - y)^2$$

Eur. Phys. J. C75 (2015) 580 $F_2 = \sum x q(x, Q^2)$ from M. Pennington, arXiv:1604.01441

unpolarized distribution $xf_a(x,Q^2)$

H. Abramowicz et al., Eur. Phys. J. C75 (2015) 580

> PDFs are very useful, but do we really know the partonic nucleon structure?

despite 50 years of studies the nucleon is still a very mysterious object, and the most abundant piece of matter in the visible Universe

 $10^{-15} \,\mathrm{m}$

6

())

 $\leq 10^{-19} \,\mathrm{m}$

parton intrinsic motion spin-k_ correlations? orbiting quarks? spatial distribution? nucleon mass?

 $10^{-14} \,\mathrm{m}$

 $10^{-10} \,\mathrm{m}$

what would we like to know ? how ?

$$\begin{split} H(k,P,\Delta) &= (2\pi)^{-4} \int d^4 z \; e^{izk} & \text{two-quark correlation} \\ &\times \left\langle p(P+\frac{1}{2}\Delta) | \bar{q}(-\frac{1}{2}z) \Gamma q(\frac{1}{2}z) | p(P-\frac{1}{2}\Delta) \right\rangle & \text{function} \end{split}$$

light-cone variables

s
$$v = (v^+, v^-, v)$$
 $v^{\pm} = \frac{1}{\sqrt{2}}(v^0 \pm v^3)$
 $x = \frac{k^+}{P^+}$ $2\xi = -\frac{\Delta^+}{P^+}$

 $\Delta=0~$ inclusive processes, cross sections $\Delta\neq 0~~{\rm exclusive~processes}, {\rm amplitudes}$

actually, things are not so simple... (example of D-Y process)

$$\langle p(P+\frac{1}{2}\Delta)|\bar{q}(-\frac{1}{2}z)\Gamma q(\frac{1}{2}z)|p(P-\frac{1}{2}\Delta)\rangle \rightarrow \langle p(P+\frac{1}{2}\Delta)|\bar{q}(-\frac{1}{2}z)\operatorname{IW}q(\frac{1}{2}z)|p(P-\frac{1}{2}\Delta)\rangle$$

the Wilson lines are path-ordered exponential of the gauge field and turn the operator product into a gauge invariant operator, but induce some process dependence

> M. Diehl, arXiv:1512.01328 J. Collins, Cambridge University Press (2011)

The nucleon landscape Markus Diehl, arXiv:1512.01328

Burkardt, Pasquini, arXiv:1510.02567

special issue of EPJA dedicated to the 3D nucleon structure, to appear soon (15 contributions, Editors M.A., P. Rossi. M. Guidal)

TMD formalism - The nucleon correlator, in collinear configuration: 3 distribution functions

 $\Phi_{ij}(k;P,S) = \sum_{X} \int \frac{\mathrm{d}^{3} P_{X}}{(2\pi)^{3} 2E_{X}} (2\pi)^{4} \delta^{4}(P-k-P_{X}) \langle PS|\overline{\Psi}_{j}(0)|X\rangle \langle X|\Psi_{i}(0)|PS\rangle$ $= \int \mathrm{d}^{4} \xi \, e^{ik \cdot \xi} \langle PS|\overline{\Psi}_{j}(0)\Psi_{i}(\xi)|PS\rangle$

$$\Phi(x,S) = \frac{1}{2} \left[\underbrace{f_1(x)}_{\mathbf{q}} \not{n}_+ + S_L \underbrace{g_{1L}(x)}_{\Delta \mathbf{q}} \gamma^5 \not{n}_+ + \underbrace{h_{1T}}_{\Delta_{\mathsf{T}} \mathbf{q}} i\sigma_{\mu\nu} \gamma^5 n_+^{\mu} S_T^{\nu} \right]$$

TMD-PDFs: the leading-twist correlator, with intrinsic k_{\perp} , contains 8 independent functions

TMDs in simple parton model TMDs = Transverse Momentum Dependent Parton Distribution Functions (TMD-PDF) or Transverse Momentum Dependent Fragmentation Functions (TMD-FF)

TMD-PDFs give the number density of partons, with their intrinsic motion and spin, inside a fast moving proton, with its spin.

there are 8 independent TMD-PDFs

only these survive in the collinear limit

 $f_{1T}^{\perp q}(x, k_{\perp}^{2})$

correlate k_{\perp} of quark with S_{\top} of proton (Sivers) $h_1^{\perp q}(x, k_\perp^2)$ correlate k_\perp and s_T of quark (Boer-Mulders)

$$\begin{array}{ll} g_{1T}^{\perp q}(x, \boldsymbol{k}_{\perp}^2) & h_{1L}^{\perp q}(x, \boldsymbol{k}_{\perp}^2) & h_{1T}^{\perp q}(x, \boldsymbol{k}_{\perp}^2) \\ & \text{different double-spin correlations} \end{array}$$

TMD-FFs give the number density of hadrons, with their momentum, originated in the fragmentation of a fast moving parton, with its spin.

 $oldsymbol{s}_q \cdot (oldsymbol{p}_q imes oldsymbol{p}_\perp)$ "Collins effect"

there are 2 independent TMD-FFs for spinless hadrons

 $D_1^q(z, \pmb{p}_\perp^2)$ unpolarized hadrons in unpolarized quarks unintegrated fragmentation function

 $H_1^{\perp q}(z, {m p}_{\perp}^2)$ correlate ${m p}_{\perp}$ of hadron with ${m s}_{m T}$ of quark (Collins)

how to "measure" TMDs?

needs processes which relate physical observables to parton intrinsic motion

SIDISDrell-Yan processes $\ell N \to \ell h X$ $p N \to \ell^+ \ell^- X$

a similar diagram for $e^+e^- \rightarrow h_1 h_2 X$ and, possibly, for $p N \rightarrow h X$

(Collins, Soper, Ji, J.P. Ma, Yuan, Qiu, Vogelsang, Collins, Metz...)

$$\begin{split} \frac{\mathrm{d}\sigma}{\mathrm{d}\phi} &= F_{UU} + \cos(2\phi) \, F_{UU}^{\cos(2\phi)} + \frac{1}{Q} \, \cos\phi \, F_{UU}^{\cos\phi} + \lambda \frac{1}{Q} \, \sin\phi \, F_{LU}^{\sin\phi} \\ &+ S_L \left\{ \sin(2\phi) \, F_{UL}^{\sin(2\phi)} + \frac{1}{Q} \, \sin\phi \, F_{UL}^{\sin\phi} + \lambda \left[F_{LL} + \frac{1}{Q} \, \cos\phi \, F_{LL}^{\cos\phi} \right] \right\} \\ &+ S_T \left\{ \frac{\sin(\phi - \phi_S) \, F_{UT}^{\sin(\phi - \phi_S)} + \sin(\phi + \phi_S) \, F_{UT}^{\sin(\phi + \phi_S)} + \sin(3\phi - \phi_S) \, F_{UT}^{\sin(3\phi - \phi_S)} \\ &+ \frac{1}{Q} \left[\sin(2\phi - \phi_S) \, F_{UT}^{\sin(2\phi - \phi_S)} + \sin\phi_S \, F_{UT}^{\sin\phi_S} \right] \\ &+ \lambda \left[\cos(\phi - \phi_S) \, F_{LT}^{\cos(\phi - \phi_S)} + \frac{1}{Q} \left(\cos\phi_S \, F_{LT}^{\cos\phi_S} + \cos(2\phi - \phi_S) \, F_{LT}^{\cos(2\phi - \phi_S)} \right) \right] \right\} \end{split}$$

LEPTON SCATTERING PLANE

TMDs in Drell-Yan processes COMPASS, RHIC, Fermilab, NICA, AFTER...

factorization holds, two scales, M², and $q_{T} \ll M$ $d\sigma^{D-Y} = \sum_{a} f_{q}(x_{1}, \mathbf{k}_{\perp 1}; Q^{2}) \otimes f_{\bar{q}}(x_{2}, \mathbf{k}_{\perp 2}; Q^{2}) d\hat{\sigma}^{q\bar{q} \rightarrow \ell^{+}\ell^{-}}$ direct product of TMDs, no fragmentation process

possible EIC kinematical coverage - Deeply Virtual Compton Scattering

Conclusions

The 3D nucleon structure is mysterious and fascinating. Many experimental results show the necessity to go beyond the simple collinear partonic picture and give new information. Crucial task is interpreting data and building a consistent 3D description of the nucleon.

Sivers and Collins effects are well established, with many transverse spin asymmetries resulting from them. Sivers function, TMDs and orbital angular momentum? QCD analysis of TMDs and GPDs sound and well developed.

Combined data from SIDIS, Drell-Yan, e+e-, with theoretical modelling, should lead to a true 3D imaging of the proton

Waiting for JLab 12, new COMPASS results, and, crucially, for an EIC dedicated facility

Thank you!
