

Transverse Spin Phenomena & Their Impact on QCD ("GaryFest") JLab, October 28, 2010

# Electroweak Loops in Elastic *ep* Scattering

Wally Melnitchouk

with Peter Blunden (Manitoba), Alex Sibirtsev (Juelich), Tony Thomas (Adelaide), John Tjon<sup>†</sup> (Utrecht)

# Outline

- *Background:* two-photon exchange in elastic *ep* scattering
  - → electric/magnetic form factor ratio puzzle: Rosenbluth separation *vs*. polarization transfer

- Parity-violating electron scattering
  - $\rightarrow$  effect of  $\gamma Z$  exchange on strange form factors
  - → dispersive corrections to proton's weak charge ("Qweak" experiment at Jefferson Lab)

#### Summary

Two-photon exchange in elastic *e-p* scattering

# **Proton** $G_E/G_M$ ratio

# Rosenbluth (Longitudinal-Transverse)

Arrington et al., PRC 68, 034325 (2003)

#### **Polarization Transfer**

Jones et al., PRL 84, 1398 (2000) Gayou et al., PRL 88, 092301 (2002)

LT method  $\sigma_R = G_M^2(Q^2) + \frac{\varepsilon}{\tau} G_E^2(Q^2)$ 

- $\rightarrow G_E$  from slope in  $\varepsilon$  plot
- -suppressed at large  $Q^2$

PT method

$$\frac{G_E}{G_M} = -\sqrt{\frac{\tau(1+\varepsilon)}{2\varepsilon}} \frac{P_T}{P_L}$$

 $\rightarrow P_{T,L}$  recoil proton polarization in  $\vec{e} \ p \rightarrow e \ \vec{p}$ 

# **Proton** $G_E/G_M$ ratio

 $\underline{\text{LT}} \text{ method}$  $\sigma_R = G_M^2(Q^2) + \frac{\varepsilon}{\tau} G_E^2(Q^2)$ 

- $\rightarrow G_E$  from slope in  $\varepsilon$  plot
- ightarrow suppressed at large  $Q^2$

 $\frac{PT}{G_E} = -\sqrt{\frac{\tau(1+\varepsilon)}{2\varepsilon}} \frac{P_T}{P_L}$ 

 $\label{eq:polarization} \begin{array}{l} \label{eq:polarization} \end{psi} P_{T\!,\!L} \mbox{ recoil proton} \\ \end{psi} \end{psi} p \mbox{olarization in } \vec{e} \ p \end{psi} \end{psi} e \ \vec{p} \end{array}$ 

#### QED radiative corrections

#### cross section modified by $1\gamma$ loop effects

Born TPE  $d\sigma = d\sigma_0 (1 + \dot{\delta})$ 

δ contains additional
 ε dependence, mostly
 from box diagrams
 (most difficult to calculate)

inelastic amplitudes

#### \* IR divergences cancel

# Two-photon exchange

interference between Born and TPE amplitudes

contribution to cross section:

$$\delta^{(2\gamma)} = \frac{2\mathcal{R}e\left\{\mathcal{M}_0^{\dagger} \ \mathcal{M}_{\gamma\gamma}\right\}}{\left|\mathcal{M}_0\right|^2}$$

"soft photon approximation" (used in all previous data analyses)

- $\rightarrow$  approximate integrand in  $\mathcal{M}_{\gamma\gamma}$  by values at  $\gamma^*$  poles
- $\rightarrow$  neglect nucleon structure (no form factors)

Mo, Tsai (1969)

# Two-photon exchange

#### "exact" calculation of loop diagram (including hadron structure)

 $\rightarrow$  few % magnitude, non-linear in  $\varepsilon$ , *positive* slope

→ will *reduce* Rosenbluth ratio

does not depend strongly on vertex form factors

# Two-photon exchange

#### Direct evidence?

- If  $1\gamma$  (2 $\gamma$ ) exchange changes sign (invariant) under  $e^+ \leftrightarrow e^-$ 
  - $\rightarrow$  ratio of  $e^+p/e^-p$  cross sections sensitive to  $\Delta(\varepsilon, Q^2)$

→ simultaneous e<sup>+</sup>p/e<sup>-</sup>p measurement using tertiary e<sup>+</sup>/e<sup>-</sup> beam to Q<sup>2</sup> ~ 1-2 GeV<sup>2</sup>
 (Hall B experiment E04-116)

## Direct evidence?

If  $1\gamma$  (2 $\gamma$ ) exchange changes sign (invariant) under  $e^+ \leftrightarrow e^-$ 

# Very preliminary Novosibirsk data

Arrington, Holt et al. (2010)

Direct evidence?

- polarization transfer with recoil proton polarized <u>normal</u> to scattering plane
  - → purely *imaginary* (does not contribute to form factor), vanishes in Born approximation!

Blunden, WM, Tjon, PRC 72, 034612 (2005)

 $\rightarrow$  effect largest at forward angles, grows with  $Q^2$ 

#### Direct evidence?

beam asymmetry for e polarized <u>normal</u> to scattering plane

 $\rightarrow$  also vanishes for one-photon exchange

Wells et al., PRC 63, 064001 (2001)

significant inelastic contributions to imaginary part of TPE

### Direct evidence?

- beam asymmetry for e polarized <u>normal</u> to scattering plane
  - $\rightarrow$  also vanishes for one-photon exchange

significant inelastic contributions to imaginary part of TPE

Parity-violating electron scattering

# Parity-violating *e* scattering

• Left-right polarization asymmetry in  $\vec{e} \ p \rightarrow e \ p$  scattering

$$A_{\rm PV} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R} = -\left(\frac{G_F Q^2}{4\sqrt{2}\alpha}\right) \left(A_V + A_A + A_s\right)$$

measure interference between e.m. and weak currents

Born (tree) level

## Parity-violating *e* scattering

• Left-right polarization asymmetry in  $\vec{e} \ p \rightarrow e \ p$  scattering

$$A_{\rm PV} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R} = -\left(\frac{G_F Q^2}{4\sqrt{2}\alpha}\right) \left(A_V + A_A + A_s\right)$$

measure interference between e.m. and weak currents

vector asymmetry  $A_V = g_A^e \rho \left[ \left( 1 - 4\kappa \sin^2 \theta_W \right) - \left( \varepsilon G_E^{\gamma p} G_E^{\gamma n} + \tau G_M^{\gamma p} G_M^{\gamma n} \right) / \sigma^{\gamma p} \right]$ 

axial vector asymmetry  $A_A = g_V^e \sqrt{\tau (1 + \tau)(1 - \varepsilon^2)} \ \widetilde{G}_A^{Zp} G_M^{\gamma p} / \sigma^{\gamma p}$ 

strange asymmetry

$$A_s = -g_A^e \rho \left( \varepsilon G_E^{\gamma p} G_E^s + \tau G_M^{\gamma p} G_M^s \right) / \sigma^{\gamma p}$$

# Two-boson exchange corrections

Born asymmetry

#### total TBE correction

$$\delta \approx \delta_{Z(\gamma\gamma)} + \delta_{\gamma(Z\gamma)} - \delta_{\gamma(\gamma\gamma)}$$

# Two-boson exchange corrections

 previous estimates computed at Q<sup>2</sup> = 0, do not include hadron structure effects
 Marciano, Sirlin (1980)

→ cancellation between  $Z(\gamma\gamma)$  and  $\gamma(\gamma\gamma)$  corrections, especially at low  $Q^2$ 

 $\rightarrow$  dominated by  $\gamma(Z\gamma)$  contribution

# Effects on strange form factors global analysis of all PVES data at $Q^2 < 0.3 \text{ GeV}^2$

$$G_E^s = 0.0025 \pm 0.0182$$
  
 $G_M^s = -0.011 \pm 0.254$   
at  $Q^2 = 0.1 \text{ GeV}^2$ 

Young et al., PRL 97 (2006) 102002

#### including TBE corrections:

 $G_E^s = 0.0023 \pm 0.0182$  $G_M^s = -0.020 \pm 0.254$ 

at  $Q^2 = 0.1 \text{ GeV}^2$ 

# Effects on strange form factors global analysis of all PVES data at $Q^2 < 0.3 \text{ GeV}^2$

$$G_E^s = 0.0025 \pm 0.0182$$
  
 $G_M^s = -0.011 \pm 0.254$   
at  $Q^2 = 0.1 \text{ GeV}^2$ 

Young et al., PRL 97 (2006) 102002

#### including TBE corrections:

$$G_E^s = 0.0023 \pm 0.0182$$
  
 $G_M^s = -0.020 \pm 0.254$   
at  $Q^2 = 0.1 \text{ GeV}^2$ 

fixed mainly by <sup>4</sup>He data ... ... TBE for <sup>4</sup>He not yet included

#### Correction to proton weak charge

in <u>forward</u> limit  $A_{\rm PV}$  measures weak charge of proton  $Q_W^p$ 

$$A_{\rm PV} \rightarrow \frac{G_F \, Q_W^p}{4\sqrt{2}\pi\alpha} t$$

= M(M + 2E)

at <u>tree level</u>  $Q_W^p$  gives weak mixing angle  $Q_W^p = 1 - 4\sin^2\theta_W$ 

## Correction to proton weak charge

including higher order radiative corrections

$$Q_W^p = (1 + \Delta \rho + \Delta_e)(1 - 4\sin^2 \theta_W(0) + \Delta'_e) + \Box_{WW} + \Box_{ZZ} + \Box_{\gamma Z} \longleftarrow \text{box diagrams}$$

 $= 0.0713 \pm 0.0008$ 

Erler et al., PRD 72, 073003 (2005)

- → WW and ZZ box diagrams dominated by short distances, evaluated perturbatively

- <u>axial</u> *h* correction  $\square_{\gamma Z}^A$  dominant  $\gamma Z$  correction in atomic parity violation at very low (zero) energy
  - → computed by Marciano & Sirlin as sum of two parts:
    - ★ low-energy part approximated by Born contribution (elastic intermediate state)
    - ★ high-energy part (above scale  $\Lambda \sim 1$  GeV) computed in terms of scattering from *free quarks*

Marciano, Sirlin, PRD **29**, 75 (1984) Erler et al., PRD **68**, 016006 (2003)

- axial *h* correction  $\square_{\gamma Z}^{A}$  dominant  $\gamma Z$  correction in atomic parity violation at very low (zero) energy
  - repeat calculation using forward dispersion relations with realistic (structure function) input

- ★ axial *h* contribution *antisymmetric* under  $E' \leftrightarrow -E'$ :  $\Re e \prod_{\gamma Z}^{A}(E) = \frac{2}{\pi} \int_{0}^{\infty} dE' \frac{E'}{E'^2 - E^2} \Im m \prod_{\gamma Z}^{A}(E')$
- ★ imaginary part can only grow as  $\log E' / E'$

 $\rightarrow$  imaginary part given by interference  $F_3^{\gamma Z}$  structure function

$$\Im m \prod_{\gamma Z}^{A} (E) = \frac{\alpha}{(s - M^2)^2} \int_{W_{\pi}^2}^{s} dW^2 \int_{0}^{Q_{\max}^2} \frac{dQ^2}{1 + Q^2 / M_Z^2} \times \frac{g_V^e}{2g_A^e} \left(\frac{4ME}{W^2 - M^2 + Q^2} - 1\right) F_3^{\gamma Z}$$

with  $g_A^e = -\frac{1}{2}, \ g_V^e = -\frac{1}{2}(1 - 4\sin^2\theta_W)$ 

- $\rightarrow$   $F_3^{\gamma Z}$  structure function
  - ★ <u>elastic</u> part given by  $G_M^p G_A^Z$
  - ★ resonance part from parametrization of  $\nu$  scattering data (Lalakulich-Paschos)
  - ★ <u>DIS</u> part dominated by leading twist PDFs at small x (MSTW, CTEQ, Alekhin)

- → energy dependence is weak
  - $\rightarrow$  correction at E = 0

 $\Re e \square_{\gamma Z}^{A}(0) = 0.0006 + 0.0002 + 0.0025 = 0.0033$   $\uparrow \qquad \uparrow \qquad \uparrow$ elastic resonance DIS

- $\rightarrow$  cf. MS value 0.0028 (or 0.7% increase)
- $\rightarrow$  resulting shift in weak charge

$$Q_W^p = 0.0713 \rightarrow 0.0718$$

Blunden, WM, Thomas (2010)

- <u>vector</u> *h* correction  $\square_{\gamma Z}^{V}$  vanishes at E = 0, but experiment has  $E \sim 1 \text{ GeV}$  what is energy dependence?
  - $\rightarrow$  forward dispersion relation

$$\bigstar \quad \Re e \prod_{\gamma Z}^{V}(E) = \frac{2E}{\pi} \int_0^\infty dE' \frac{1}{E'^2 - E^2} \ \Im m \prod_{\gamma Z}^{V}(E')$$

★ integration over E' < 0 corresponds to crossed-box, vector h contribution symmetric under  $E' \leftrightarrow -E'$ 

$$\rightarrow \text{ imaginary part given by}$$

$$\Im m \prod_{\gamma Z}^{V} (E) = \frac{\alpha}{(s - M^2)^2} \int_{W_{\pi}^2}^{s} dW^2 \int_{0}^{Q_{\max}^2} \frac{dQ^2}{1 + Q^2/M_Z^2}$$

$$\times \left( F_1^{\gamma Z} + F_2^{\gamma Z} \frac{s \left(Q_{\max}^2 - Q^2\right)}{Q^2 (W^2 - M^2 + Q^2)} \right)$$

Gorchtein, Horowitz, PRL 102, 091806 (2009)

# $\rightarrow$ $F_{1,2}^{\gamma Z}$ structure functions

- ★ parton model for <u>DIS</u> region  $F_2^{\gamma Z} = 2x \sum e_q g_V^q (q + \bar{q}) = 2x F_1^{\gamma Z}$ 
  - $\rightarrow F_2^{\gamma Z} \approx F_2^{\gamma}$  good approximation at *low x*
  - $\rightarrow$  provides upper limit at *large* x  $(F_2^{\gamma Z} \lesssim F_2^{\gamma})$
- ★ in <u>resonance</u> region use phenomenological input for  $F_2$ , empirical (SLAC) fit for R
  - → for transitions to I = 3/2 states (e.g.  $\Delta$ ), CVC and isospin symmetry give  $F_i^{\gamma Z} = (1 + Q_W^p) F_i^{\gamma}$
  - → for transitions to I = 1/2 states, SU(6) wave functions predict Z &  $\gamma$  transition couplings equal to a few %

#### compare structure function input with data

Sibirtsev, Blunden, WM, Thomas, PRD 82, 013011 (2010)

# Combined vector and axial *h* correction

$$Q_W^p = 0.0713(8) \rightarrow 0.0765^{+0.0014}_{-0.0009}$$

- significant shift in central value, errors within projected experimental uncertainty  $\Delta Q_W^p = \pm 0.003$ 

# Summary

- Two-photon exchange corrections resolve most of Rosenbluth / polarization transfer  $G_E^p/G_M^p$  discrepancy
  - $\rightarrow$  striking demonstration of limitation of one-photon exchange approximation in *ep* scattering
  - → direct tests from  $e^+/e^-$  comparison; polarization observables
- Dramatic effect of  $\gamma(Z\gamma)$  corrections at forward angles on proton weak charge,  $\Delta Q_W^p \sim 7\%$ , *cf.* PDG
  - $\rightarrow$  would significantly shift extracted weak angle
  - → will be better constrained by direct measurement of  $F_{1,2,3}^{\gamma Z}$  (e.g. in PVDIS at JLab)

# The End

Gorchtein, Horowitz, PRL 102, 091806 (2009)

(see also Gorchtein, Horowitz, Ramsey-Musolf, arXiv:1003.4300 [hep-ph])

$$\Re e \,\delta_{\gamma Z} = \Re e \,\Box_{\gamma Z}^V / Q_W^p \approx 6\%$$

mostly from high-W ("Regge") contribution

- → our formula for  $\Im m \square_{\gamma Z}^{V}$  factor 2 larger (incorrect definition of parton model structure functions: "nuclear physics" vs. "particle physics" weak charges!)
- → GH omit factor (1-x) in definition of  $F_{1,2}$ (~30% enhancement)
- → GH use  $Q_W^p \sim 0.05 \ cf. \sim 0.07$ (~40% enhancement)
- numerical agreement coincidental!
