Introduction of timing RPC

The MULTIGAP Resistive Plate Chamber

Essentially a stack of resistive (glass) plates with electrodes stuck on the outside

Note 1: internal glass plates electrically floating - take and keep correct voltage by electrostatics and flow of electrons and ions produced in gas avalanches

Note 2: resistive plates transparent to fast signals - induced signals on external electrodes is sum of signals from all gaps

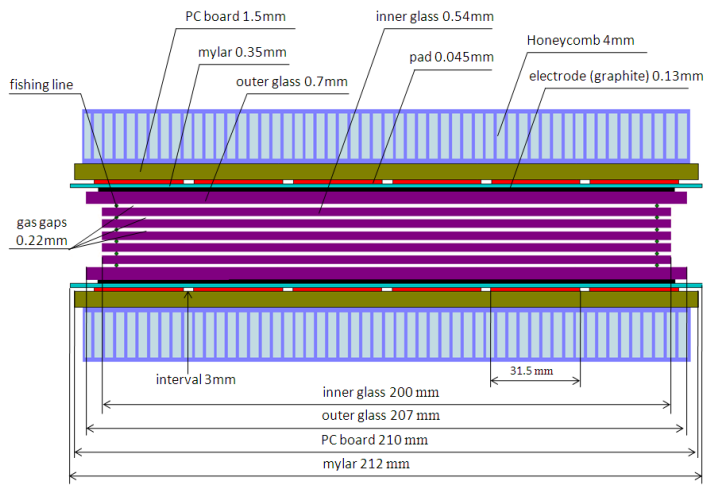

Large area, high granularity
Good time resolution < 80ps
High efficiency > 95%
Low cost

ALICE, STAR, FOPI, HADES
HARP, CBM and NICA-MPD

Four kinds of MRPC prototypes

STAR Experiment

Requirement for STAR-TOF

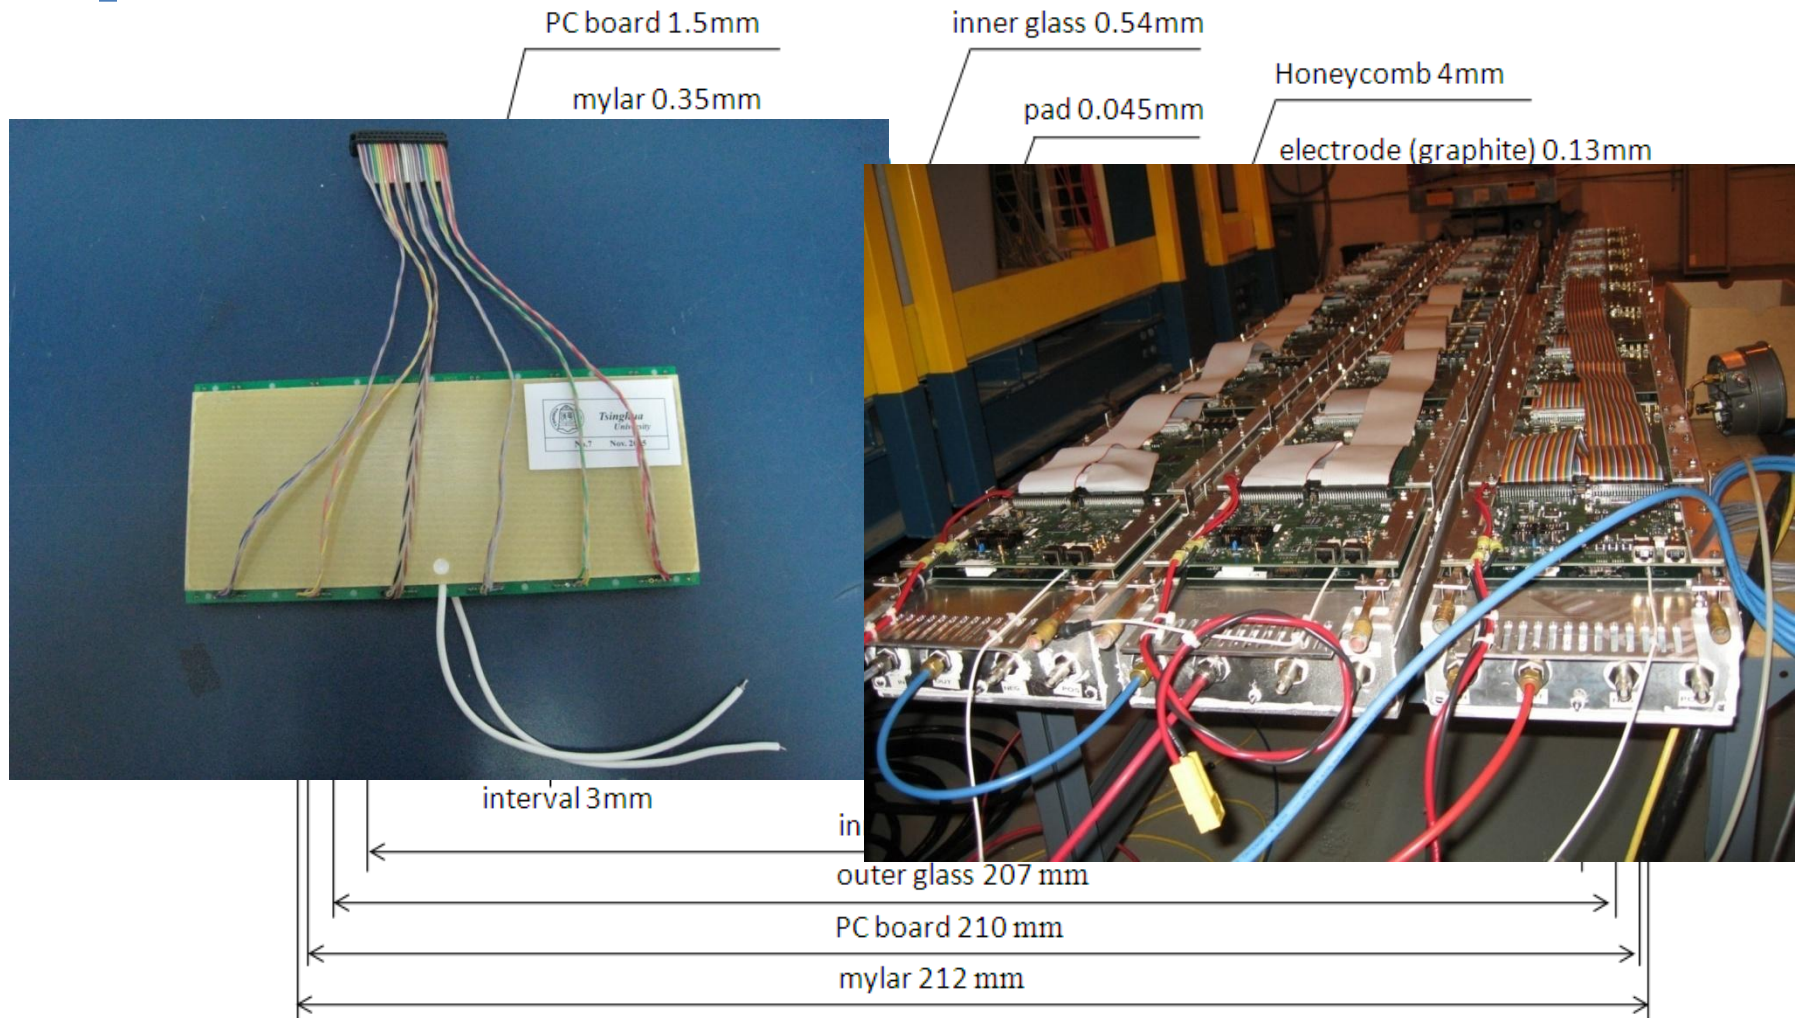

Large acceptance TOF detector to dramatically extend STAR's scientific reach through enhanced PID.

120 Trays of MRPC modules to cover acceptance of the STAR TPC.

- The detector segmentation : the occupancy per channel is below 10-15%.
- The system must fit into the space for the present CTB system.
- The system must be able to operate at particle fluxes up to ~ 300 Hz/cm²
